

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1 (original): A method of processing images, wherein
inputted image data is subjected to image processes and the processed image data is
outputted, comprising the steps of
sequentially dividing inputted image data into small blocks of image data, each having a
data volume according to the characteristics of an image process to be performed,
sequentially performing an image process on said small blocks of image data to
sequentially obtain small blocks of processed image data,
and sequentially outputting said small blocks of processed image data to an output
destination.

2 (original): A method of processing images as defined in claim 1, wherein
said inputted image data is divided into said small blocks of data in accordance with the
access characteristics of said inputted image data.

3 (original): A method of processing images as defined in claim 1, wherein
said inputted image data is cached, and
said cached inputted imaged data is divided into the small blocks of image data.

4 (original): A method of processing images as defined in claim 1, wherein
said processed small blocks of image data are sequentially cached, and

AMENDMENT UNDER 37 C.F.R. § 1.111
U.S. APPLN NO. 10/078,499

output data is outputted from said cached small blocks of processed image data, according to the characteristics of the output destination.

5 (original): A method of processing images as defined in claim 1, wherein the image processes are performed in accordance with the characteristics of the inputted image data and/or the characteristics of the output destination.

6 (original): A method of processing images as defined in claim 1, wherein a determination is made as to whether or not the image process dependent on the output destination is valid or not, based on the characteristics of the input destination of the inputted image data and the output characteristics of the output destination, and for cases in which it is determined that the image process dependent on the output destination is valid, the processing dependent on said output destination is substituted for the aforementioned processing.

7 (original): An image processing apparatus for subjecting inputted image data to image processes and output processed image data, and which comprises an input means for sequentially dividing inputted image data into small blocks of image data according to the characteristics of the image processes to be performed, a processing means for sequentially subjecting said small blocks of image data to an image process to sequentially obtain small blocks of processed image data, and an output means for sequentially outputting said small blocks of processed image data to an output destination.

8 (original): An image processing apparatus as defined in claim 7, wherein

AMENDMENT UNDER 37 C.F.R. § 1.111
U.S. APPLN NO. 10/078,499

the input means is a means for dividing the inputted image data into small blocks in accordance with the access characteristics of said inputted image data, also.

9 (original): An image processing apparatus as defined in claim 7, further comprising an input caching means for caching the inputted image data, wherein the input means is a means for dividing the cached inputted image data into small blocks of image data.

10 (original): An image processing apparatus as defined in claim 7, further comprising an output caching means for sequentially caching the small blocks of processed image data, wherein

the output means is a means for outputting output data from said cached small blocks of processed image data according to the characteristics of the output destination.

11 (original): An image processing apparatus as defined in claim 7, wherein the image processing means is a means for performing image processes based on the characteristics of the inputted image data and/or the characteristics of the output destination.

12 (original): An image processing apparatus as defined in claim 7, further comprising a control means for determining whether the image process dependent on the output destination of the inputted image data is valid, based on the characteristics of the input destination of the inputted image data and the output characteristics of the output destination, and controlling, for cases in which it has been determined that the image process dependent on the output destination is valid, the image processing means so that the processing dependent on the output destination is performed instead of the aforementioned processing.

AMENDMENT UNDER 37 C.F.R. § 1.111
U.S. APPLN NO. 10/078,499

13 (original): A computer readable storage medium capable of recording a program that causes a computer to execute the image processing method wherein inputted image data is subjected to an image process and the thus processed image data is outputted, comprising a procedure for sequentially dividing inputted image data into small blocks of image data, each having a data volume according to the characteristics of an image process to be performed, a procedure for sequentially performing an image process on said small blocks of image data to sequentially obtain small blocks of processed image data, and a procedure for sequentially outputting said small blocks of processed image data to an output destination.

14 (original): A computer readable storage medium as defined in claim 13, wherein the procedure for dividing the inputted image data into the small blocks of data is a procedure for dividing the inputted image data into the small blocks of data in accordance with the access characteristics of said inputted image data.

15 (original): A computer readable storage medium as defined in claim 13, further comprising

an input caching procedure for caching the inputted image data, wherein the procedure for dividing the inputted image data into the small blocks of data is a procedure for dividing the cached inputted image data into the small blocks of image data.

16 (original): A computer readable storage medium as defined in claim 13, further comprising

an output caching procedure for sequentially caching the small blocks of processed image data, wherein

AMENDMENT UNDER 37 C.F.R. § 1.111
U.S. APPLN NO. 10/078,499

the procedure for outputting the small blocks of processed image data is a procedure for outputting output data from said cached small blocks of processed image data according to the characteristics of the output destination.

17 (original): A computer readable storage medium as defined in claim 13, wherein the procedure for obtaining the small blocks of processed image data is a procedure for performing image processes based on the characteristics of the inputted image data and/or the characteristics of the output destination.

18 (original): A computer readable storage medium as defined in claim 13, further comprising

a control procedure for determining whether the image process dependent on the output destination of the inputted image data is valid, based on the characteristics of the input destination of the inputted image data and the output characteristics of the output destination, and a procedure for performing, for cases in which it has been determined that the image process dependent on the output destination is valid, the image processing procedure so that the processing dependent on the output destination is performed instead of the aforementioned processing.

19 (new): A method of processing images as defined in claim 1, wherein the step of sequentially dividing the inputted image data into small blocks of image data comprises receiving the inputted image data line by line at a first memory and the step of sequentially performing the image process comprises:

first processing a_1 lines of the inputted image data to generate first data when b lines of image data have been received at the first memory, b being greater than a_1 ;

AMENDMENT UNDER 37 C.F.R. § 1.111
U.S. APPLN NO. 10/078,499

storing the first data in a second memory; and

second processing a2 lines of the first data stored in the second memory.

20 (new): A method of processing images as defined in claim 19, wherein the first processing is x direction enlargement and the second processing is y direction enlargement.

21 (new): A method of processing images as defined in claim 19, wherein the first processing is color space conversion and the second processing is resolution conversion.

22 (new) A method of processing an image divided into a plurality of portions comprising a first portion, a second portion and a third portion, said method comprising the steps of:

storing the first portion in a first memory;

first processing the first portion stored in the first memory in a first image process to generate a processed first portion and storing the second portion in the first memory, the operation of first processing the first portion and the operation of receiving the second portion in the first memory substantially occurring in parallel;

storing the processed first portion in a second memory; and

second processing a portion of the processed first portion stored in the second memory in a second image process, first processing the second portion stored in the first memory in the first image process and storing the third portion in the first memory, the operation of second processing the portion of the processed first portion, the operation of first processing the second portion and the operation of storing the third portion in the first memory substantially occurring in parallel,

AMENDMENT UNDER 37 C.F.R. § 1.111
U.S. APPLN NO. 10/078,499

wherein each of the first portion, the second portion and the third portion has a corresponding image data having a data volume according to characteristics of at least one of the first image process and a second image process.

23 (new): A method of processing images as defined in claim 22, wherein the first image process is x direction enlargement and the second image process is y direction enlargement.

24 (new): A method of processing images as defined in claim 22, wherein the first image process is color space conversion and the second image process is resolution conversion.

25 (new): A method of processing images as defined in claim 2, wherein the access characteristics of said inputted image data comprises format type of image data.

26 (new): A method of processing images as defined in claim 2, wherein the access characteristics of said inputted image data comprises format type of image data including JPEG format, bitmap format and RAW format.
